# MODELS & ADJUSTMENTS

## THREADED SPRING PRELOAD ADJUSTMENT

All our shock absorbers come standard with a threaded preload adjustment that allows you to fine-tune the initial force applied on the springs and precisely balance the weight distribution across the front and rear wheels. This adjustment is required to set up the ride height (ground or chassis clearance) and to lower or raise the vehicle, allowing you to adapt to various situations or to suit your personal preferences.

You can easily adjust the preload by turning the red anodized ring located on top of the springs using the provided tool. A locking set-screw (3 mm Allen key provided) tightly secures the ring to prevent it from coming out of adjustment when riding. Although the preload adjustment procedure is easier to achieve when the vehicle is lifted on a stand, it can also be done on the trail.

STAGE 2 +R

STAGE 4

## REBOUND DAMPING ADJUSTMENT

The rebound adjustment controls the speed at which the shock absorbers return to their fully extended position after being compressed from an impact. Although the rebound valving is customized for your riding type, sometimes you might need to further adjust the rebound.

Since not all riding conditions or tracks are the same, the rider will want to adapt the rebound damping to match them. By adjusting the rebound properly, the wheels can stay on the ground as much as possible to get maximum traction and reduce the bucking effect of the spring pressure pushing back after an impact. Elka Suspension offers two types of rebound adjusters (depending on vehicle model): an easy to use twisting knob and a compact adjuster that can be set with a flat screwdriver, both of which have detented clicks.

STAGE 2 +R

STAGE 4

## DUAL HIGH-SPEED (BLACK KNOB) & LOW-SPEED (RED KNOB) COMPRESSION DAMPING ADJUSTMENTS

Elka Suspension's High- & Low-Speed Compression adjustment is an internal cartridge with two distinct circuits that control the hydraulic resistance for both high-velocity and low-velocity oil displacement. This enables very advanced fine-tuning for different types of impacts that would otherwise require the rider to make a compromise between a more comfortable softer suspension and a high-performance harder suspension.

With this dual adjustment, the driver can have the suspension set to react differently for high-speed situations and low-speed situations at the same time. Learning and understanding how to dial-in the Elite compression adjustment might require a little time and effort, but it will reward the rider with a suspension that work wonders over any kind of terrain and obstacles.

With the Elite compression adjustment, the driver can fine-tune the shock absorbers to react differently for riding situations that would otherwise require a compromise to be made between opposed optimal settings. Elite compression adjustment is for drivers who demand the highest performance and adjustability.

### EXAMPLES OF SITUATIONS THAT AFFECT THE LOW-SPEED COMPRESSION

- Body roll when cornering
- Rear-end squatting under hard acceleration
- Front-end diving when braking
- Riding over whoops at moderate speed
- Undulations and elevation changes in the terrain

### EXAMPLES OF SITUATIONS THAT AFFECT THE HIGH-SPEED COMPRESSION

- Landing from big jumps
- Harsh or sudden square-edged impacts
- Riding at high-speed over whoops
- Vibration when riding at very high speed or when riding over choppy terrain and tire tracks

ABBREVIATION	ADJUSTMENT	DESCRIPTION
PRE	THREADED SPRING PRELOAD	ALLOWS FINE-TUNING OF THE VEHICLE'S RIDE HEIGHT (SAG)
REB	REBOUND DAMPING	CONTROLS THE SPEED AT WHICH THE SHOCK RETURNS TO ITS FULLY EXTENDED POSITION AFTER AN IMPACT OR COMPRESSION MOVEMENT
COMP	COMPRESSION DAMPING	CONTROLS THE OVERALL LEVEL OF RESISTANCE WHEN THE SHOCK IS BEING COMPRESSED (STIFF OR SOFT)
HS COMP	HIGH-SPEED COMPRESSION DAMPING	ALLOWS SEPARATE FINE-TUNING OF THE LEVEL OF RESISTANCE WHEN THE SHOCK IS QUICKLY BEING COMPRESSED (SQUARE-EDGE IMPACTS, HARSH LANDINGS, ETC.)
LS COMP	LOW-SPEED COMPRESSION DAMPING	ALLOWS SEPARATE FINE-TUNING OF THE LEVEL OF RESISTANCE WHEN THE SHOCK IS SLOWLY BEING COMPRESSED (BODY ROLL, ACCELERATION, CORNERING, ETC.)
